

GOLF BALL DIMPLES

ABSTRACT

A golf ball has a substantially spherical outer surface comprised of a plurality of non-circular
5 dimples. The dimples are formed by a plurality of lobes extending from a central hub, wherein
each lobe is defined by a curved outer segment. The curved outer segments form at least a
portion of the perimeter of the dimple. The dimples are comprised of at least four lobes. The
dimples can also be comprised of a plurality of radiating arms emanating from a location
proximate the hub of the dimple.
